**Model T12.10, universally programmable, head mounting version**

**Model T12.30, universally programmable, rail mounting version**

WIKA data sheet TE 12.03

for further approvals  
see page 8

### Applications

- Process industry
- Machine building and plant construction

### Special features

- Universally configurable via Windows PC, sensor simulation not required
- Insulation voltage AC 1,500 V between sensor and current loop
- Signalling configurable for sensor break and sensor short-circuit
- For 100 % relative humidity, condensation allowed

### Description

These temperature transmitters are designed for universal use in industrial applications. They offer high accuracy, galvanic isolation and protection against electromagnetic influences (EMI).

In addition to the different sensor types, e.g. sensors in accordance with DIN EN 60751, JIS C1606, DIN 43760, DIN EN 60584 or DIN 43710, customer-specific sensor characteristics can also be defined through the input of pairs of values.

The connection type is configurable, thus ensuring optimal connecting cable compensation. A cold junction compensation for thermocouples is built-in, while an external cold junction can also be used.

The configurable error signalling (e.g. sensor break, hardware errors, sensor over/under-range) ensures a high degree of monitoring functionality.

Configuration changes can be quickly and easily transmitted to the T12 using the WIKA\_T12 configuration software (free download at [www.wika.com](http://www.wika.com)) and the communication interface (programming unit), which is available as an accessory. The bidirectional communication makes it possible to display the measured values also on the PC/notebook.

The programming unit provides voltage to the temperature transmitter model T12, so that no additional voltage supply is required to configure the T12.

The dimensions of the head-mounted transmitter match the form B DIN connecting heads with extended mounting space, e.g. WIKA model BSS. The transmitters in rail mounting cases are suitable for all standard rails in accordance with IEC 60715.

The transmitters are delivered with a basic configuration or configured according to customer specifications.

## Total measuring deviation addition: input + output per DIN EN 60770, 23 °C $\pm 5$ K

EV End value of the configured measuring range

1) Greater value applies

2) The double value applies in case of extended ambient temperature range (-50 ... +85 °C)

3) Thermocouples types T, K, N, U: valid only for configured start of measuring range  $\geq -150$  °C

4) Can be compensated manually by measurement of the resistance value.

5) Within a range up to 250  $\Omega$  lead resistance

## Monitoring

Test current for sensor monitoring <sup>6)</sup>	nom. 33 $\mu\text{A}$ during test cycle, otherwise 0 $\mu\text{A}$
Sensor break monitoring	activated
Self-monitoring	Initial test is carried out automatically after connecting the power supply
